

TLP: CLEAR

CALIFORNIA CYBERSECURITY INTEGRATION CENTER

CYBER ADVISORY

Friday, April 24, 2026

CAL-CSIC-202604-A-006

Multiple Critical Vulnerabilities impacting ESRI Portal for ArcGIS

Unauthorized Access

Privilege Escalation

Patch Available

Requires trusted user

The California Cybersecurity Integration Center (Cal-CSIC) has identified two critical vulnerabilities impacting ESRI's Portal for ArcGIS version 11.4, 11.5, and 12.0 on Windows, Linux and Kubernetes. CVE-2026-33518 is an incorrect privilege assignment vulnerability that carries a CVSS 3.1 score of 9.8.¹ Successful exploitation of this vulnerability enables attackers who possess elevated privileges to generate credentials that may compromise system integrity and provide unauthorized access to other resources. CVE-2026-33518 impacts ESRI's Portal for ArcGIS version 11.5 running on Windows and Linux operating systems. Although this vulnerability is not being exploited as a zero-day or is known to be exploited in the wild, organizations with ESRI Portal for ArcGIS deployments should treat this as an urgent exposure.

CVE-2026-33519 is an incorrect authorization vulnerability that does not correctly check permissions assigned to developer credentials and carries an CVSS 3.1 score of 9.8.² Successful exploitation allows attackers to abuse developer credentials that bypass the portal's permission checks, enabling the attacker to gain full administrative control over the portal instance. CVE-2026-33519 impacts ESRI Portal for ArcGIS versions 11.4, 11.5, and 12.0 running on Windows, Linux, and Kubernetes, regardless of deployment platform. CVE-2026-33519 is not confirmed to be exploited as a zero day or in the wild.

The Cal-CSIC recommends immediately following the vendor's guidance regarding remediation, that includes immediate patching for both vulnerabilities.³
